

Applied AI Foundation

workflow

Defining a goal

Gathering information

Making sense of inputs

Drafting

Reviewing

Deciding what comes next

Sharing the result

goal → make the process clearer and easier to review and repeat

workflow has 5-parts

(Goal → Context is steps)

checkpoints → output

Why workflow? - from what you should compare a workflow with? →

Single prompt - is not enough for a well defined task

→ workflow - best for big tasks

How to start with
Define a goal, Start with a draft, Review
the output, Adjust as needed

How to choose our workflow

Keep a timeline (weekly is ideal)

Have a clear outcome or deliverable

Has steps and decisions

Opportunity to review and improve work

Practice without sharing highly sensitive info

Reasoning Model

Highly capable long thinking model...

for: Several conditions

① Multiple possible paths

② Deviation of recommendation

• Plan with dependency

• A need to compare options

• Check work against
criteria

What we can do with reasoning model

• Planning, ① Constraints

① Nuance, ② Review

① Comparison

The Power of Reasoning

It helps in 5 main things

- 1 - Planning
- 2 - Constraints
- 3 - Comparison
- 4 - Nuance
- 5 - Review

→ 203

Your direction	Reasoning Model	Structured output
① Set the goal	① organise information	Clear Plan
② Give Context	② Checks logic	Step by step answers
③ Add guardrails	③ Build structure	Useful framework
	④ Identifies gaps	More structured work

Review and refine

Check the response → Improve the next Prompt → Iterate and repeat

Combing

Set the goal, Supply context, Provide guardrails
Check the work, Refine

Apply reasoning to your workflow

Reasoning and Tools - 3 module

How to choose the simplest useful, capability

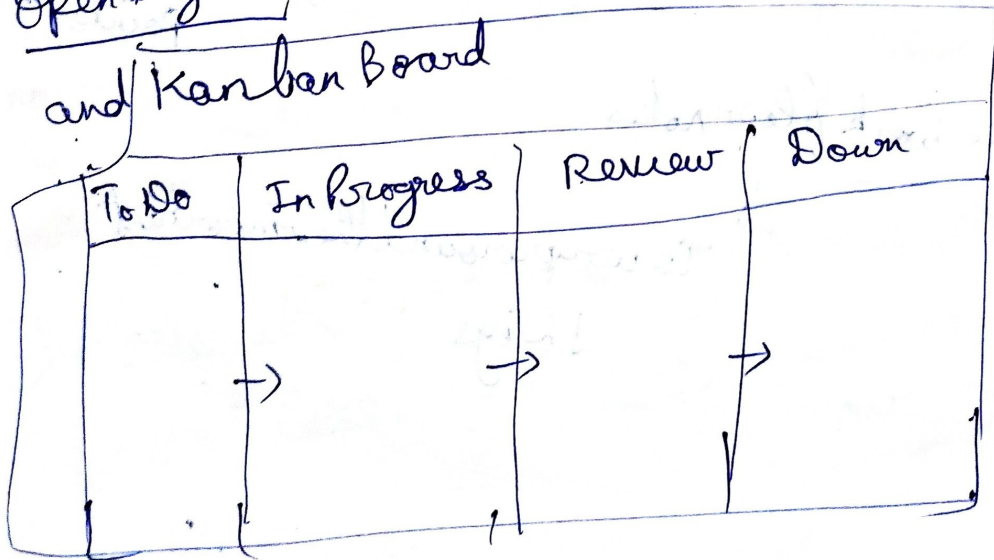

tool - When they ground the work, reduce guessing -
or make the workflow easier to review

Plugins

Plugins are tools for external AIs, they are used
by AI - Agents to retrieve information

- While learning Plugins, I came to know about
OpenProject - open Source Project management tool

and Kanban Board

Need to learn - How to use OpenProject, Slack, Notion

Choose the Right Capability 3.6

reasoning - Planning or comparing

file - Extract info

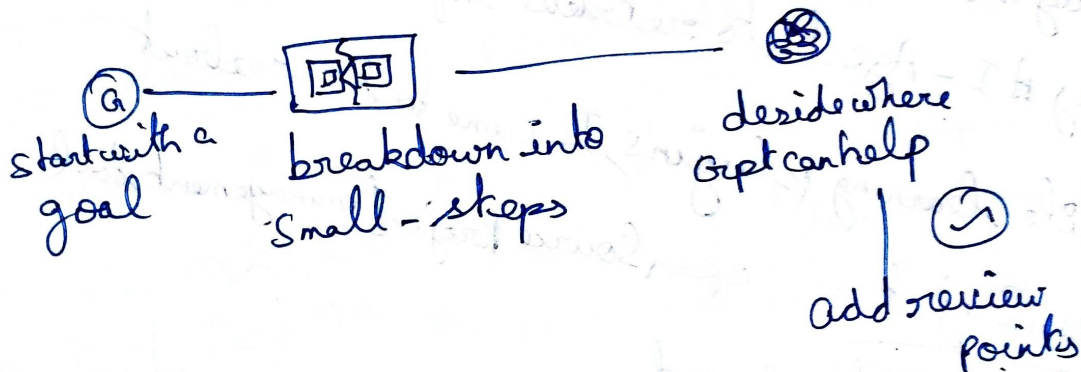

data analysis - Spreadsheets or structured data

search & deep research, image upload, voice, plugins

agents

4- Design the Workflow

4.1. Start with the goal

① Create workflow notes

↓
To wrap around the important things

4.6 Set up a skill

Skill → How to complete a task the way you do
Skill → instructions, examples, preferences

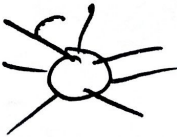

workflow has
↳ ① Repeatable process, ② clear inputs, ③ useful steps, ④ a defined output, ⑤ final checks
skill development after completing a workflow of that week

I am completing my weekly Meeting workflow Pack. Help me reflect on the workflow. I have built so far

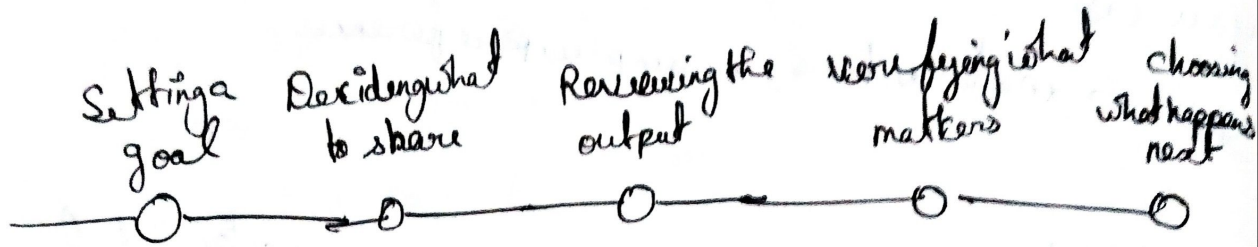

Use these headings:
My repeatable workflow, My required input, My step by step process, My output format, My final quality checks.
Where GPT can help me most ...

This helps in creating a good skill

The overall Goal is to turn the

Broad Goal  into structured workflow

The Responsible Use in Workflow

make it more
accurate, responsible, useful

What did GPT help most
Where did the workflow drift
Where capability added value
Which capability added complexity

which prompt or workflow
note helped most?
what did I need to verify?
what should I change next
time?

review for the steps that can be

repetitive?

Judgement?

automated?

never be fully given to AI?
